Overview

What is Colombia's power system like?

Colombia's power system is characterised by large installed capacity for hydropower (70% of total capacity), mostly from plants with significant reservoir capacity. VRE generation capacity, below 1% in 2017, would reach 17% by 2030 under the revised energy plan (UPME, 2018). Additional biomass power by 2030 would account for 3% of capacity.

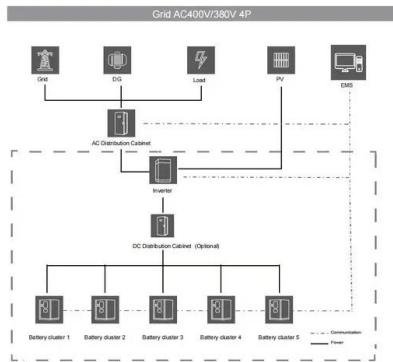

Will Colombia's hydropower system be flexible in 2030?

While system flexibility was sufficient, coal and oil use rose to compensate for less hydropower output. This meant higher system costs and carbon dioxide (CO₂) emissions. Colombia is not expected to face flexibility issues in 2030 even with lower rainfall.

What is Colombia's energy transition process?

Colombia's energy transition process is underway. Former President Ivan Duque set a goal to increase non-conventional renewable energy installed capacity from one percent to more than 12 percent of the energy matrix by 2022.
