What is solar energy & how does it work?

Solar energy is the radiation from the Sun capable of producing heat, generating electricity, or causing chemical reactions. In this video, we will learn about the invention of solar panels and how they work. Towards the end, we will see the pros and cons of solar energy. Let's Learn about the topic with this video. What if animals could talk?

.

How does a solar inverter work?

Solar inverters convert DC electricity into AC electricity, the electrical current appliances run on when plugged into a standard wall socket. Other types of solar technology include solar hot water and concentrated solar power. They both use the sun's energy but work differently than traditional solar panels.

How do solar panels work?

A solar panel is essentially two layers of silicon, like the material found in sand. One layer is positively charged and one is negatively charged, like the batteries we made earlier. Sun strikes the layers, excites electrons between them, which flow onto this wire mesh and off the panel.

How does concentrated solar power work?

Concentrated solar power (CSP) works similarly to solar hot water in that it transforms sunlight into heat—but it doesn't stop there. CSP technology concentrates solar thermal energy using mirrors and turns it into electricity. At a CSP installation, mirrors reflect the sun to a focal point.

How do solar panels convert solar energy into heat?

Instead, the solar panels, known as "collectors," transform solar energy into heat. Sunlight passes through a collector's glass covering, striking a

component called an absorber plate, which has a coating designed to capture solar energy and convert it to heat.

How do solar panels create electricity?

But if you want to explore how solar panels create electricity a bit more, we'll explain what you should know. Solar cells are typically made from a material called silicon, which generates electricity through a process known as the photovoltaic effect.
